ORION® Mobile Read v3 1.0.1 Release Notes

Update Information & Requirements

Existing users will be prompted to update the application when they open it or login. New users can go to the Downloads page in BEACON to access the new version of ORION® Mobile Read. That said, this update is optional. If you do not need any of the new features and enhancements, you can safely ignore the update.

New Features

1. Added Single Sign On support to OMR v3. This lets utilities utilize their corporate sign on capabilities to manage field user access to OMR.

2. OMR v3 now lets you use VersaProbe Handheld devices via Bluetooth or serial connection to collect meter readings from touch pads.

Improvements

1. While installing OMR, the installer now defaults to "Everyone." This makes the application discoverable under all user profiles instead of just the profile of the user who installed OMR.

2. Automatic Retry of Data Sync – Weak or intermittent internet connections can sometimes cause the database transmission process to fail, leaving the user with an invalid local database. The automatic retry now lets OMR and BEACON complete the database transfer.

Bug Fixes

1. If an ME/CE receiver was preconfigured and the assignment list did not include one of those technology types, pressing the Play button to start reading caused the application to quit.

2. When a USB or serial com port connection did not have a port name, the application would terminate without an error message.
